1. Getting Involved

For now, the best way to get involved is by downloading the source, building it, and playing with it. Participate in the forums, etc..

1.1. Building

Building is pretty easy. The only prerequisites are that [ANT](#) is installed/setup and that you have the [Log4j](#) jar file in your classpath. This can be done simply by placing the jar file into the meta-jb/dev/lib directory of your source checkout.

1.2. Conditional Packages

Some packages are built conditionally based on certain external jar files being present. See the [dependencies](#) page for details. These jar files can simply be placed in the meta-jb/dev/lib directory as mentioned above.
